

Final Report:

Lecture note 6

1. Build a glider using styrene sheet, balsa wood rods, and weights.
2. Measure the specifications of the constructed aircraft.
3. Determine the center of gravity position and moment of inertia((B6-1) and (B6-2)).
4. Express the aerodynamic forces X_a and Z_a acting on the aircraft in terms of the aircraft state variables using equations (B5-3) to (B5-15) and (B6-3).
5. Implement the aerodynamic force model in the Matlab program.
6. Conduct simulations for various initial values.

Deadline: February 12

Submission Destination: LMS
